Sentinel Credit Analyst

Can an automated high-yield analyst read debt disclosures while keeping numerical analysis deterministic?

LLM-assisted SEC research pipeline | 5 November 2026

THE RESULT The verifier checks source quotes, amounts and reconciliation to reported total debt. A deliberately fabricated extraction appears in the test suite. The latest reviewed daily workflow runs failed at the agent step, so unattended daily coverage has not been established.

APPROACH

SEC XBRL feeds fundamentals; an LLM extracts debt tranches and drafts constrained memos. Plain code checks source quotes, amounts and debt reconciliation before tranches enter recovery waterfalls. A hash-linked stance ledger records changes.

SCOPE & LIMITATIONS

The verifier’s tolerance and source-text matching do not guarantee complete debt extraction. Scores are heuristic; no bond spread or market-return validation exists. A hash chain alone does not prevent history rewriting or independently timestamp calls.

EXPLORE

Use the sample site preview or a clearly labelled mock/rules-only walkthrough. python -m pytest -q is offline; SEC retrieval needs an identifying user agent and live access.
